Why accumulator tank?

The function of an accumulator tank is simple and is based on the principle that hot water is lighter than cold. Hot water from the boiler is pumped into the top of the tank, while cold water is retrieved from the bottom of the tank.

For this process to work as intended, the border between hot and cold water has to be sharp. If hot and cold water are mixed all the time, the overall temperature will be lower. This means that the capacity will be lower – in worst case the energy won't be enough even for one single shower.

The secret behind perfect separation is to control the intake of the tank so the separation is not disturbed. The fitting that accomplishes this is called a charging unit, and the market leading charging unit is Laddomat®.

Example of tank without separation

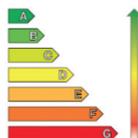

Example of tank with separation

Why LADDOTANK®?

- Accumulation technique has always been our strength!
- Laddotank is a tank produced for today's and future energy sources.
- The DHW coil is made in stainless steel (316L), which makes it less vulnerable to for example lime rich water, where copper coils are much more vulnerable.
The coil shakes slightly when the water is circulating, which lowers the risk of coating even further.
- Tanks up to 500 l comes with hard PUR insulation (not removable), while larger tanks comes with preassembled soft polyester fleece insulation. Thanks to low weight and zipper, the insulation is easy to take off and on. The insulation meets applicable EU directives and classifications for today's accumulator tanks. The insulation has fire classification B1 according to DIN 4102.
- Thanks to one DHW coil stretching all the way from the bottom to the top, no extra external connections has to be made to connect the pre-heating coil with the top coil.
- All coils are built to ensure you get hot water for your system in best and fastest possible way. This thanks to corrugated coils made with thoroughly tested dimensions and lengths.
- Termoventiler has been market leader in thermal heating systems since 1996.
- Our technical know-how in system solutions makes it possible to help YOU choose the best accumulator tank for YOUR application.

LADDOTANK® EFFICIENT STORAGE OF THERMAL ENERGY
IN WATERBORNE HEATING SYSTEMS

LADDOTANK® PUFFER

Buffer tank

TECHNICAL DESCRIPTION

Laddotank has been designed for thermal energy storage in waterborne heating system, and to optimize the operating conditions of the heat source (ie. heat pump, oil, wood, pellet, sun etc).

The tank increases the user's heating comfort significantly thanks to a steady supply of thermal energy even when the boiler is not running.

MATERIAL

Steel construction with exterior paint.

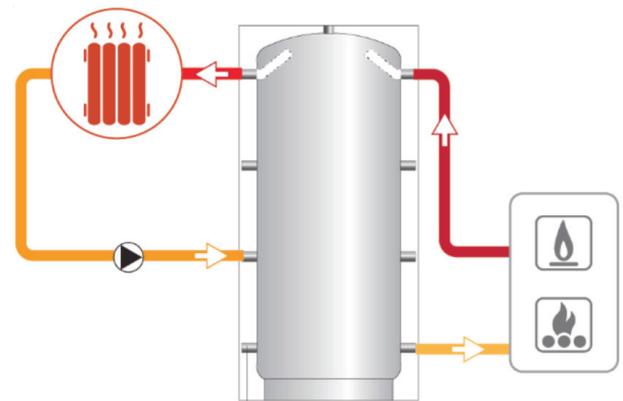

INSULATION

Model 500: Hard PUR (not removable).

Other models: Soft polyester fleece, made of 100% recyclable material, with high thermal insulation and low thermal conductivity: 0,035 W / mK.

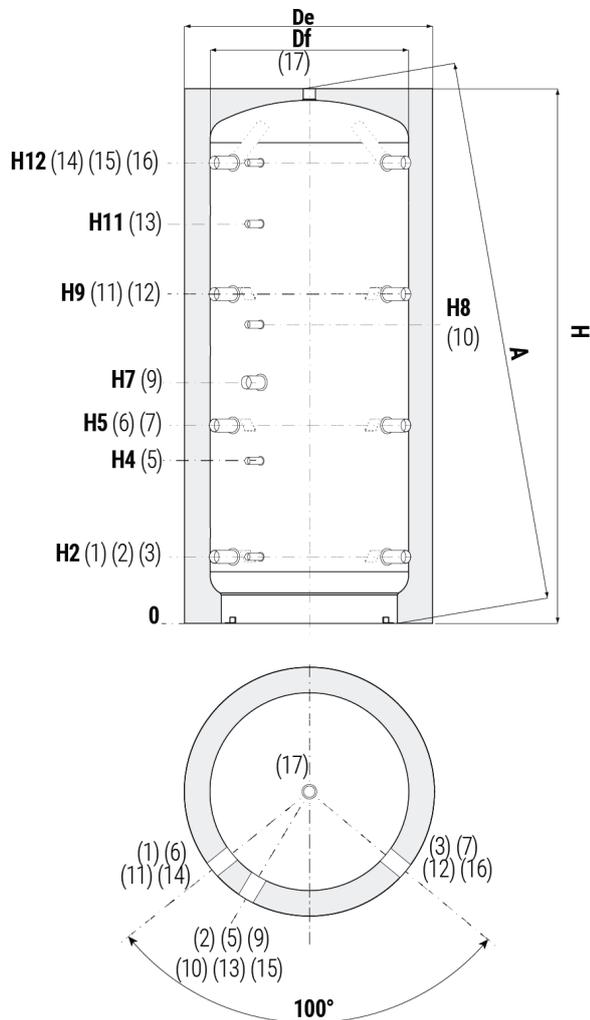

Fire resistance class Bs2d0 according to EN 13501 (B1 according to DIN 4102).

Covered in gray PVC jacket and lid.

Example of system

LADDOTANK® ECO COMBI 1

Accumulator tank with one stainless steel coil, for domestic hot water (DHW).

TECHNICAL DESCRIPTION

Laddotank has been designed for thermal energy storage in waterborne heating system, and to optimize the operating conditions of the heat source (ie. heat pump, oil, wood, pellet, sun etc).

The tank can produce hot water for sanitary use thanks to the built-in coil made of stainless steel.

The tank makes it possible to maintain a good hot water production, even if the temperature in the primary system isn't very high (for example heat pump as primary source and solar heat as support).

The tank increases the user's heating comfort significantly thanks to a steady supply of thermal energy even when the boiler is not running.

MATERIAL

Steel construction with exterior paint.

DHW COIL

Stainless (316L) steel corrugated pipes, suitable for drinkable water according to D.M. n. 174 dated 06.04.04.

CAPACITY (COIL)

See page 21.

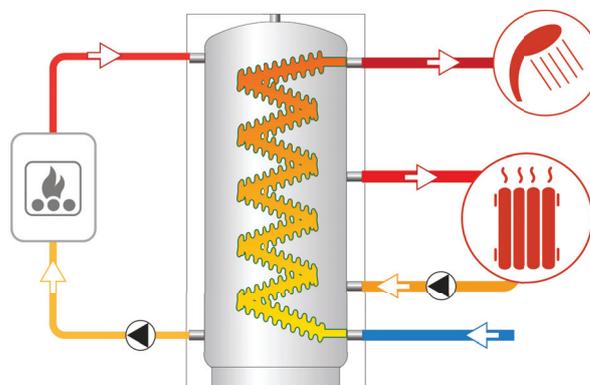

INSULATION

Model 500: Hard PUR (not removable).

Other models: Soft polyester fleece, made of 100% recyclable material, with high thermal insulation and low thermal conductivity: 0,035 W / mK.

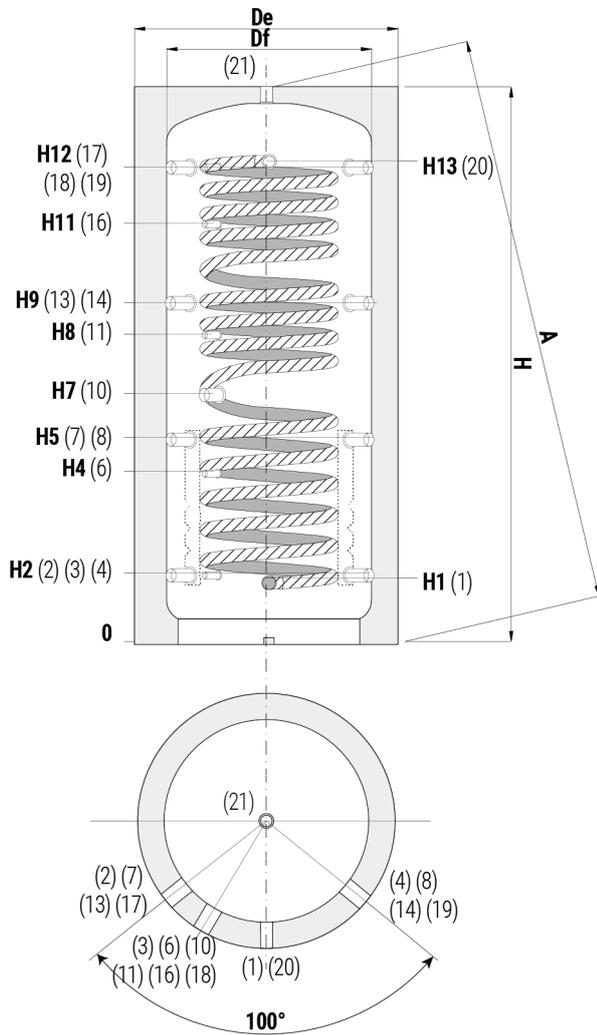

Fire resistance class Bs2d0 according to EN 13501 (B1 according to DIN 4102).

Covered in gray PVC jacket and lid.

LADDOTANK® ECO COMBI 2

Accumulator tank with one stainless steel coil for domestic hot water and one heating coil for connecting extra heat source, for example solar collectors.

TECHNICAL DESCRIPTION

Laddotank has been designed for thermal energy storage in waterborne heating system, and to optimize the operating conditions of the heat source (ie. heat pump, oil, wood, pellet, sun etc).

The tank can produce hot water for sanitary use thanks to the built-in coil made of stainless steel.

The tank makes it possible to maintain a good hot water production, even if the temperature in the primary system isn't very high, for example heat pump as primary source and solar heat as support.

Thanks to the design with heating coil, the tank also makes it possible to use two different heat sources, for example biofuel and solar heat.

The tank increases the user's heating comfort significantly thanks to a steady supply of thermal energy even when the boiler is not running.

MATERIAL

Steel construction with exterior paint.

DHW COIL

Stainless (316L) steel corrugated pipes, suitable for drinkable water according to D.M. n. 174 dated 06.04.04.

HEATING COIL

1 pcs heating coil, formable steel.

CAPACITY (COILS)

See page 21.

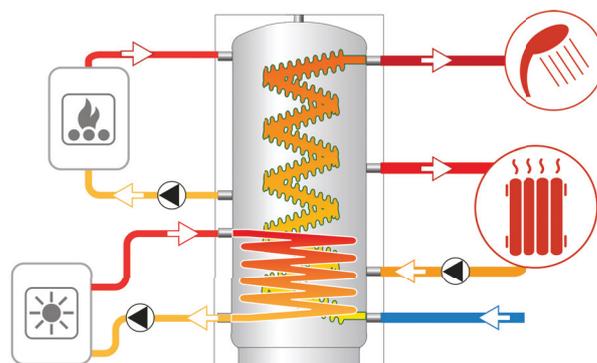

INSULATION

Model 500: Hard PUR (not removable).

Other models: Soft polyester fleece, made of 100% recyclable material, with high thermal insulation and low thermal conductivity: 0,035 W / mK.

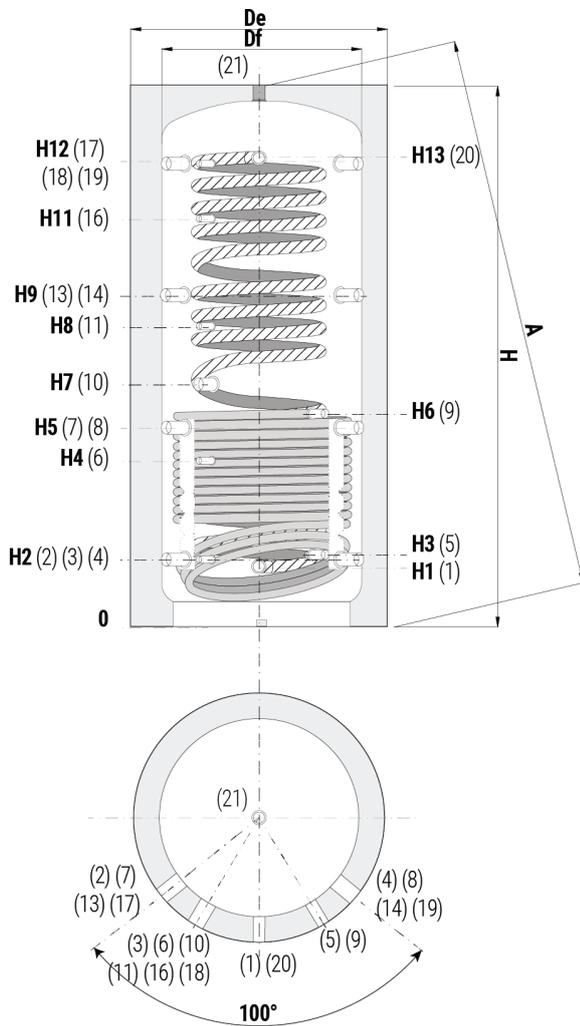

Fire resistance class Bs2d0 according to EN 13501 (B1 according to DIN 4102).

Covered in gray PVC jacket and lid.

*Available with soft fleece on special order, Df = 650 mm

Gray = In stock. For other models, please contact us.

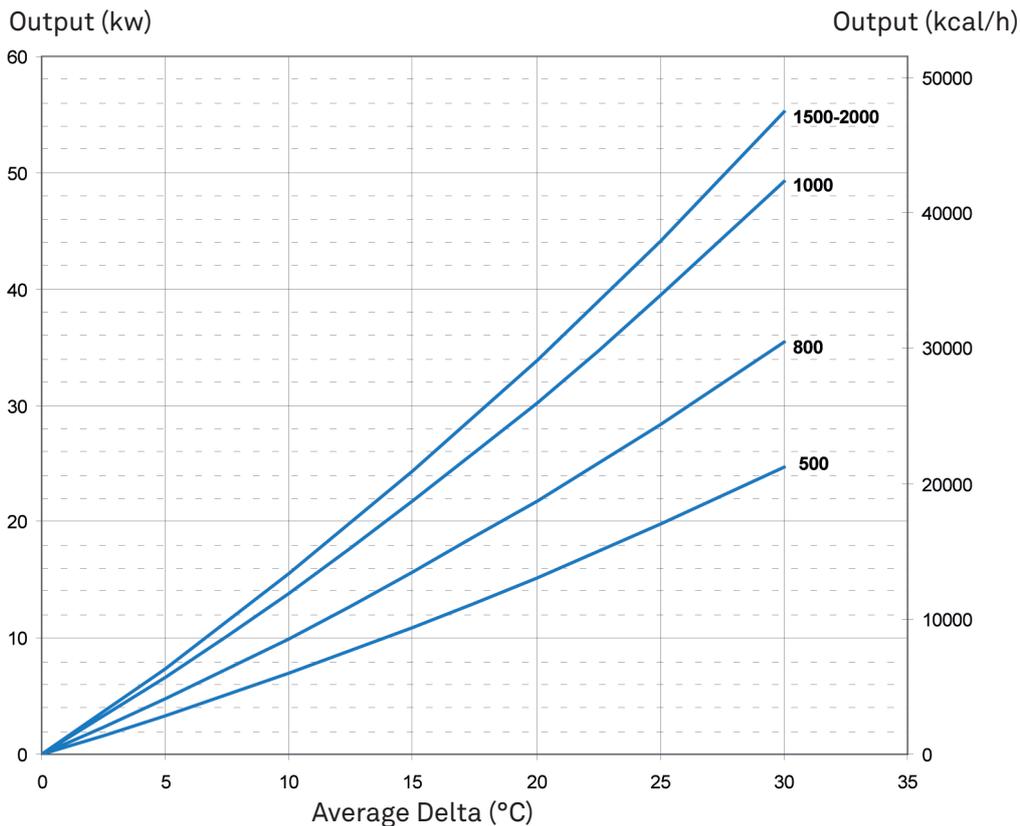

Puffer 1 & 2 – (Lower) Fixed heat exchanger powers chart

Thermal output is given in both kW or kcal/h in terms of average temperature difference between primary and secondary circuit, all for a range of primary 3 m³/h. For example, a PUFFER 1 of 1000 liters Capacity with a water flow of 3 m³/h at 80 °C inlet and outlet at 70 °C, has on the storage of water an average temperature of 60 °C, the mean difference of temperature will be:
 $(80 + 70) / 2 - 60 = 15$ °C and therefore you can exchange up to approximately 28 kW.

Output of the lower heat exchangers PUFFER depending on the average DeltaT between primary and accumulation considering flow rate 3 m³/h.

Puffer 2 – (Upper) Fixed heat exchanger powers chart

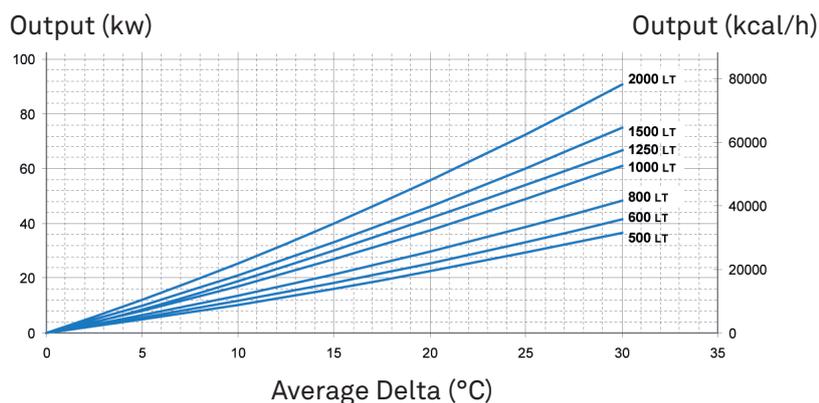

Eco Combi – Output and performances

D.H.W storage performances

			Complete heated storage volume	Complete heated storage volume	Upper part heated storage volume	Upper part heated storage volume
Model	DHW Volume	DHW exchanger Surface	Max sanitary water produced from 10°C to 45°C with storage at 65°C and boiler on	Max sanitary water produced from 10°C to 45°C with storage at 65°C and boiler off	Max sanitary water produced from 10°C to 45°C with storage at 65°C and boiler on	Max sanitary water produced from 10°C to 45°C with storage at 65°C and boiler off

Eco Combi 2 – (Lower) Fixed heat exchanger powers chart

Thermal output is given in both kW or kcal/h in terms of average temperature difference between primary and secondary circuit, all for a range of primary 3 m³/h.

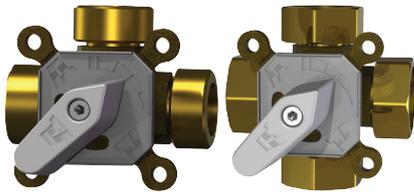

For example, a 1000 liters ECO COMBI 2 with a water flow of 3 m³/h at 80 °C inlet and outlet at 70 °C, has on the storage of water an average temperature of 60 °C, the mean difference of temperature will be: $(80 + 70) / 2 - 60 = 15$ °C and therefore you can exchange up to approximately 28 kW.

Output of the ECO COMBI 2 lower heat exchangers depending on the average DeltaT between primary and accumulation considering flow rate 3 m³/h.

Accessories

Immersion heater 6 kW or 9 kW

Mixing valves

Thermometer incl. submersible tube

Radiator / circulation pumps

Charging units and regulators, see main catalogue
